                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention is directed to novel antisense compounds targetted to breast cancer-1 proteins and their encoding nucleic acids. The invention is useful for the diagnosis, prevention and/or treatment of diseases and conditions associated with aberrant expression and activity of breast cancer-1 such as a hyperproliferative disorder in particular breast, ovary, prostate and peritoneum cancers. The invention is also used in antisense therapy. The present sequence is human breast cancer-1 antisense oligonucleotide. Note: This sequence given in example 15 of the specification differs from that given in the sequence listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonuclectide compounds, useful for diagnosing, preventing and/or treating conditions with aberrant activity of breast cancer-1, such as breast, ovary, prostate and/or peritoneum cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Brown-Driver VL,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention is directed to novel antisense compounds targetted to breast cancer-1 proteins and their encoding nucleic acids. The invention is useful for the diagnosis, prevention and/or treatment of diseases and conditions associated with aberrant expression and activity of breast cancer-1 such as a hyperproliferative disorder in particular breast, ovary, prostate and peritoneum cancers. The invention is also used in antisense therapy. The present sequence is human breast cancer-1
                                     This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This oligonucleotide sequence is a human clone specific PCR primer used in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 4 A; 7 C; 7 G; 2 T; 0 U;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 15; Page 32; 175pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          target oligonucleotide.
                                                                                                                                                                                                                                                    WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
           which normally participates in embryonic development, cell differentiation and stimulates apoptosis via caspase-3 activation. The present invention describes antisense oligonucleotides that comprise a
                                           This invention relates to a novel antisense compounds that modulate the expression of human geranyleranyl diphosphate synthase 1 (also known as GGPS1, geranylegranyl pyrophosphate synthatese, GGPPS, gyppsase and geranyltranstransferase) and located on chromosome 1p43. Specifically, refers to compositions useful for inhibiting the expression of GGPS1, which compositions useful for inhibiting the corposations.
                                                                                                                                                    New antisense oligonucleotides for modulating geranylgeranyl synthase 1 expression, useful for diagnosing, preventing or t conditions associated with the protein, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antisense; ss; human; geranylgeranyl diphosphate synthase 1; GGPS1; geranylgeranyl pyrophosphate synthetase; GGPS; ggppsase; geranyltranstransferase; embryonic development; cell differentiation; apoptosis; 2' MOE wing; phosphorothioate backbone; developmental;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADJ10322 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                    The present invention relates to a panel of two or more single nucleotide polymorphisms, where each of the polymorphisms of the panel are selected from single nucleotide polymorphisms that are not genetically linked with respect to one another, and where each of the polymorphisms of the panel are selected from single nucleotide polymorphisms that are located outside tandem repeat nucleic acid sequences. The known sample is from a family member. The compromised nucleic acid sequences comprises nucleic acid fragments from 10-100 nucleotides in length. The identity of the one or more single nucleotide polymorphisms is determined using a single base primer extension reaction. The present sequence represents a primer of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  least one modified nucleobase, a 5-methylcytosine. Accordingly, these compounds are useful for treating a disease or condition associated with GGPS1 such as a developmental or hyperproliferative disorder (e.g. cancer) that arise as a result of aberrant apoptosis. As such, these compositions exhibit cytostatic activity and are useful for diagnostics, prophylaxis, research reagents and various kits. This oligonucleotide sequence is a phosphorothicate antisense DNA oligo used to modulate human geranylgeranyl diphosphate synthase 1 expression in an exemplification of
                                                                                                                                                                                                                                                acid
                                                                                                                                                                                                                                                            New panel of single nucleotide polymorphisms comprising two or more single nucleotide polymorphisms, useful for analyzing compromised nucleic

                                                                                                                                                                                                                                                                          The present invention relates to a panel of two or more single nucleotide polymorphisms, where each of the polymorphisms of the panel are selected from single nucleotide polymorphisms that are not genetically linked with respect to one another, and where each of the polymorphisms of the panel are selected from single nucleotide polymorphisms that are located outside tandem repeat nucleic acid sequences. The known sample and the unknown sample are from the same individual. The known sample and the family member. The compromised nucleic acid sample comprises nucleic acid fragments from 10-100 nucleotides in length. The identity of the one or more single nucleotide polymorphisms is determined using a single base primer extension reaction. The present sequence represents a primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New panel of single nucleotide polymorphisms comprising two or more single nucleotide polymorphisms, useful for analyzing compromised nucleic

The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The Chuman mpGES-1 gene is located on chromosome 9, more specifically to Q34.3. The present invention also describes: (1) antisense compounds, CC 934.3. The present invention also describes: (1) antisense compounds, CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1 in cells or tissues; and (3) a method of tracting the expression of CC mpGES-1 in cells or tissues; and (3) a method of tracting an animal CC having a disease or condition associated with mPGES-1. MPGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, CC antifilammatory, neuroprotective, nootropic, antiarthritic, vasotropic, CC antifilammatory, immunomodulator, cardiant, neuroprotective, vasotropic, CC ophthalmological, immunomodulatory and cardiovascular activities, and can CC be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chimeric; antisense oligonucleotide; phosphorothioate; human; timeric; antisense oligonucleotide; phosphorothioate; human; chimericsomal prostaglandin E2 synthase; mpCES-1; mpCES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; hlzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immunomodulatory; cardiovascular; gene therapy; inflammation; Alzhelmer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antientary; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human mPGES-1 chimeric antisense oligonucleotide SEQ ID NO:1256.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-JUL-2004 (first

MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, vasotropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., ischaemia or reperfusion injury, or disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                              neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.

mPGES-1

ç

sequence represents a chimeric antisense oligonucleotide human microsomal prostaglandin E2 synthase (mPGES-1). Th

gene is located on chromosome 9, more specifically to resent invention also describes: (1) antisense compounds,

The present invention also

useful

having a sequence targeted to a nucleic acid l for preparing a composition for treating e.g. disease, arthritis, diabetes, cancer or

e.g.,

New antisense compound,

CC antisense or condition associated with mpGES-1 and can be used as mpGES-1, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibits; its expression; (2) a method of inhibiting the expression of CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, antiarthritic, vasotropic, CC ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

CC necessary immunomodulatory and in gene therapy. The antisense compound condition associated with mpGES-1 chimeric condition associated with mpGES-1 chimeric continuation, neuroprotective, nootropic, antisties, and can be used as mpGES-1 inhibitors and antisense compounds have cytostatic, condition associated with mpGES-1 chimeric contininflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's condition associated with mpGES-1 e.g., inflammation injury, or condition injury, or

                                                                                       ફ
                                                                                                                                                                                                         The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 Synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, inhibits its expression; (2) a method of inhibiting the expression; (2) a method of inhibiting the expression of mpGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, and cantisense oligonucleotides and antisense compounds have cytostatic, ophthalmological, immunomodulator, cardiant, neuroprotective, antisense compound can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                       Query Match

                                                                                         The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chimeric; antisense oligonucleotide; phosphorothicate; human
antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's

The CC human mPCES-1 gene is located on chromosome 9, more specifically to CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mPCES-1, which specifically hybridise with the nucleic acid encoding CC mPCES-1, which specifically hybridise with the nucleic acid encoding CC mPCES-1 in cells or tissues; and (3) a method of inhibiting the expression of CC having a disease or condition associated with mPCES-1. MPCES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, and in gene therapy. The antisense compound cophthalmological, immunomodulatory and cardiovascular activities, and can CC be used as mPCES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or condition associated with mPCES-1 e.g., inflammation, Alzhimer's comboling and control of the condition associated with mPCES-1 e.g., inflammation injury, or condition injury, or condition associated with mPCES-1 e.g., inflammation injury, or condition injury injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        문

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 853
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a chimeric antisense oligonucleotide characteristics of the present sequence represents a chimeric antisense oligonucleotide trargeted to human microsomal prostaglandin E2 synthase (mpGES-1). The characteristic pane is located on chromosome 9, more specifically to CC 9434.3. The present invention also describes: (1) antisense compounds, mpGES-1, which specifically hybridise with the nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and can inhibite its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal chaving a disease or condition associated with mpGES-1. MpGES-1 chimeric antisinse oligonucleotides and antisense compounds have cytostatic, anticinate particial, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritie, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound con be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's cophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                  S
                                                                                                                                                                                                                                     The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The CC human mPGES-1 gene is located on chromosome 9, more specifically to CC 9d34.3. The present invention also describes: (1) antisense compounds, expression; (2) a method of inhibits expression; (2) a method of inhibiting the expression; (2) a method of inhibiting the expression of CC mPGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mPGES-1. MPGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, antiense oligonucleotides and antisense compounds have cytostatic, contininflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, antiinflammatory, neuroprotective, nootropic, antiarthrities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's CC ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                    Matches

The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The CC human mpGES-1 gene is located on chromosome 9, more specifically to CC 9934.3. The present invention also describes: (1) antisense compounds, CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC mpGES-1 in cells or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonuclectides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, antiaritritic, vasotropic, cophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's condition associated with mpGES-1 condition injury, or condition injury, or condition associated with mpGES-1 condition injury, or condition injury injury.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mBGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric

The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

```
antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiinflammatory, neuroprotective, nootropic, antiinflammatory, neuroprotective, nootropic, antiinflammatory, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alabeimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                  The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 4; SEQ ID NO 231; 132pp; English

antidiabetic, immunomodulator, cardiant, neuroprotective, assotropic, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                        The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9344.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression, (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antissues of condition associated with mPGES-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; notiropic; ophthalmological; neuroprotective; notiropic; ophthalmological;

The present targeted to

sequence represents a chimeric human microsomal prostaglandin

antisense oligonucleotide E2 synthase (mPGES-1). The

ຄຄວິດຄວິດຄວິດຄວິດຄວິດຄວິດຄວິດຄວິດຄວິດ

ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotrantiinflammatory, neuroprotective, nootropic, antiarthritic, neuroprotective, nootropic, antiarthritic, neuroprotective, nootropic, antiarthritic, neuroprotective, neuropr

vasotropic ties, and c

human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric

The present sequence represents a chimeric antisense oligonucleotide cc targeted to human microsomal prostaglandin E2 synthase (mPCES-1). The CC human mPCES-1 gene is located on chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, cc having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPCES-1, which specifically hybridise with the nucleic acid encoding cc mPCES-1 in cells or tissues; and (3) a method of tracting an animal cc mPCES-1 in cells or tissues; and (3) a method of tracting an animal cc mpcES-1 in cells or tissues; and (3) a method of tracting an animal cc antisense oligonucleotides and antisense compounds have cytostatic, cc antidiabetic, immunomodulator, cardiant, neuroprotective, and can cc ophthalmological, immunomodulatory and cardiovascular activities, and can cc can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's contacting a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's contacting a disease or condition associated with mPGES-1 e.g., inflammation reperfusion injury, or condition associated with mPGES-1 e.g., inflammation, Alzheimer's contacting a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflamm

                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mbGES-1 gene is located on chromosome 9, more specifically to 20 4934.3. The present invention also describes: (1) antisense compounds, C mpGES-1, which specifically hybridise with the nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and C inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal c may be a modern of the expression of mpGES-1 in cells or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, or antininflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or cardiant, in the composition of the
                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The CC human mPGES-1 gene is located on chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, CC mPGES-1, which specifically hybridise with the nucleic acid encoding comprise a sequence comprising 8-30 bp targeted to a nucleic acid encoding compGES-1, which specifically hybridise with the nucleic acid mPGES-1 and CC inhibits its expression; (2) a method of inhibiting the expression of compGES-1 in cells or tissues; and (3) a method of treating an animal compGES-1 in cells or condition associated with mPGES-1. MPGES-1 chimeric cantidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antiarthritic, vasotropic, capthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's composition disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

        The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-JUL-2004
                                                                                                                                                                                                                                        New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The CC human mpGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, CC antisflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulator, and in gene therapy. The antisense compound CC on the used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or content of the condition injury, or condition associated with mpGES-1 e.g., inflammation, Alzheimer's condition associated with mpGES-1 e.g., inflammation injury, or condition associated with mpGES-1 e.g., inflammation, Alzheimer's condition condition associated with mpGES-1 e.g., inflammation, alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

```
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding compGES-1, which specifically hybridise with the nucleic acid encoding compGES-1, which specifically hybridise with the nucleic acid encoding compGES-1 in cells or tissues; and (3) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal compounds and in the mace of condition associated with mpGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, cantidiabetic, immunomodulator, cardiant, neuroprotective, or antidiabetic, immunomodulator, and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound con be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's componition of the disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                       The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The CC human mPGES-1 gene is located on chromosome 9, more specifically to CC 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and CC mPGES-1 in cells or tissues; and (3) a method of inhibiting the expression of CC mPGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mPGES-1. MPGES-1 and CC antisense oligonucleotides and antisense compounds have cytostatic, CC antisiabetic, immunomodulator, cardiant, neuroprotective, and can attisense or condition associated, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's CC ophthalmic, immunological, cardiovascular or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                   Matches

The present sequence represents a chimeric antisense oligonucleotide crargeted to human microsomal prostaglandin E2 synthase (mPCES-1). The CC human mPCES-1 gene is located on chromosome 9, more specifically to (2) 934.3. The present invention also describes: (1) antisense compounds, (2) antisense compounds, (2) antisense compounds, (3) a method of inhibiting the expression of (4) a method of inhibiting the expression of (5) antisense compounds and (6) antisense compounds (7) a method of treating an animal (7) antisense compounds have cytostatic, (8) antisense com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mpGES-1 imPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; notropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGSS-1). The human mPGSS-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, avsotropic, antinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmolgical, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             microsomal prostaglandin E2 synthase; mpGES-1; mpGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antinflammatory; neuroprotective; notropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; lamunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a chimeric antisense oligonucleotide contrared to human microsomal prostaglandin E2 synthase (mpGES-1). The CC human mPGES-1 gene is located on chromosome 9, more specifically to CC 934.3. The present invention also describes: (1) antisense compounds, CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MPGES-1 and CC antisinglammator, candilator, cardiant, neuroprotective, antisinflammatory, neuroprotective, nootropic, antisinflammatory, neuroprotective, nootropic, antisinflammatory, neuroprotective, nootropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's composition injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The human mEGES-1 gene is located on chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression, (2) a method of inhibiting the expression of mPGES-1 in cells or tissues, and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric having a disease or condition associated with mPGES-1.
                                                                                                                                                                                                                                                                           antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiarthritic, vasotropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

                                                                                                                                                                                                                                                   having a sequence comprising 8-30 bp targeted to a nucleic acid mpGES-1 which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiarinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or antisense, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or antisense compound condition associated with mpGES-1 e.g., inflammation, Alzheimer's condition associated with mpGES-1 e.g., inflammation, and iscales or condition associated with mpGES-1 e.g., inflammation, alzheimer's condition associated with mpGES-1 e.g., inflammation and inflammatical condition associated with mpGES-1 e.g., inflammatical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.ginflammation, Alzheimer's disease, arthritis, diabetes, cancer or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.
                                                                                                                                                                                   Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-SEP-2002; 2002US-0413549P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WO2004028458-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            modified_base

having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric

antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiarinflammatory, neuroprotective, nootropic, antiarthritic, vasotropi ophthalmological, immunomodulatory and cardiovascular activities, and

vasotropic,

can

be used as mPGES-1 inhibitors and in gene therapy. The antisense componers to be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, ophthalmic, immunological, cardiovascular or neurological disorder.

compound

CC targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The CC human mpGES-1 gene is located on chromosome 9, more specifically to CC '934.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and CC inhibits its expression; (2) a method of inhibiting the expression of CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC mpGES-1 in cells or tissues; and (3) a method of treating the expression of CC antisense oligonucleotides and antisense compounds have cytostatic, cantidiabetic, immunomodulator, cardiant, neuroprotective, antiarthritic, vasotropic, CC antissiamentory, neuroprotective, nootropic, antiarthritics, and can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder. Sequence 20 BP; 4 A; 8 C; 3 G; 5 T; 0 U; 0 Other; The present sequence represents a chimeric antisense oligonucleotide

The human mpGES-1 gene is located on chromosome 9, more specifically to 9344.3. The present invention also describes: (1) antisense compounds, chaving a sequence comprising 8-30 by targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal mpGES-1 in cells or tissues; and (3) a method of treating an animal chaving a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonuclectides and antisense compounds have cytostatic, antisense oligonuclectides and antisense compounds have cytostatic, antisticiammatory, neuroprotective, nootropic, antiarthritic, vasotropic, antiinfilammatory, neuroprotective, nootropic, antiarthrities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischemia or reperfusion injury, or ophthalmore and condition associated with mpGES-1 e.g., instancial disease.

                                                                                                                                                                                                                                                                                                                    The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of thibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric
                                                                                                                                                              antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGBS-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alabeimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                     Sequence 20 BP; 4 A; 5 C; 9 G; 2 T; 0 U; 0 Other;

The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The CC human mPGES-1 gene is located on chromosome 9, more specifically to CC 934.3. The present invention also describes: (1) antisense compounds, CC mPGES-1, which specifically hybridise with the nucleic acid encoding CC mPGES-1, which specifically hybridise with the nucleic acid encoding CC mPGES-1 in cells or tissues; and (3) a method of inhibiting an animal CC antisense or condition associated with mPGES-1. MPGES-1 and CC antisense or conditions and antisense compounds have cytostatic, CC antisense oligonucleotides and antisense compounds have cytostatic, CC antisinflammatory, neuroprotective, noctropic, antiarthritic, vasotropic, CC ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or CC ophthalmoic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antinflammatory; neuroprotective; notropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human mPGES-1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human mPGES-1 chimeric antisense oligonucleotide SEQ ID NO:261.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-JUL-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADM14074 standard;
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mBGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encodimpGES-1, which specifically hybridise with the nucleic acid mPGES-1 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              modified_base

MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiarthritic, vasotropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (NYCE/) NYCE J W.

Claim 2; SEQ ID NO 734; 174pp; English

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3'-end or 3'-end of a nucleic acid target cochesen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-6 receptor, CCR1, CCR1, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC prevention and/or treatment of a respiratory or lung disease. The CC cran, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The CC respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or levels of adenosine and/or levels of adenosine (c), chronic obstructive pulmonary disease (COPD), chronic obstructive pulmonary disease (COPD), chronic obstructive pulmonary disease (COPD), prevention or This accuse represents an oligonary pulmonary disease in the prevention or the provided respiratory or lung inflammation, bronchitis, airway disease (COPD), and the prevention or the prevention of the prevention or the prevention of the prevention or the prevention or the prevention or the prevention or the prevention of the prevention or the prevention of the prevention or the prevention of the prevention of the preventio bronchoconstriction. This sequence represents an oligonucleotide of the

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-4 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The CC prevention and/or treatment of a respiratory or lung disease. The CC pene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The CC useful for preventing or treating a respiratory or lung disease. The CC and/or increased levels of, adenosine and/or levels of adenosine of allergic rhinitis, acute respiratory disease. The respiratory or lung disease (COPD), chronic obstructive pulmonary disease (COPD), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory bistress syndrome, pulmonary disease and post pulmonary disease are allergic rhinitis, acute respiratory bistress syndrome, pulmonary disease of the pronchactory disease represents an oligonucleotide of the

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL) 4 receptor, interleukin (IL) 5' receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The CC useful for preventing or treating a respiratory or lung disease. The CC respiratory or lung disease is associated with hyper-responsiveness to a receptor(s), and/or asthma and/or lung allergies associated with a receptor(s), and/or asthma and/or lung allergies associated with constituents of a stream and/or lung allergy, asthma, impeded respiration, CC cystic fibrosis (CP), chronic obstructive pulmonary disease (CDD), chronic constructive pulmonary disease (CDD).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 2; SEQ ID NO 736; 174pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
